- True fir mortality from bark beetles
- Spruce beetle / true fir mortality from bark beetles
- Western spruce budworm defoliation
- Aspen defoliation
- New Mexico fir looper

*\*Only agents affecting greater than 5,000 acres Region-wide are depicted.*

The insect and disease activity depicted here is based on aerial detection surveys and should only be used as a general indicator of incidence. This map represents the mortality and defoliation that has occurred since the previous surveys in 2004. Depending upon the timing of survey, the entire extent of some insect and disease activity may not have been detected. In addition, most diseases cause gradual declines in tree health that are not typically detectable during aerial surveys. Intensity of damage is variable, thus not all trees within a mapped area are dead or defoliated. Caution should be used in interpreting these results due to the subjective nature of aerial sketch mapping and the scale of mapping. Areas of particular concern should be ground-checked for precise determination of location and causal agent.

**Arizona**  
Survey conducted July through September, 2005, by Steve Dudley and Bobbe Fitzgibbon, Forest Health, Arizona Zone Office, Southwestern Region, USDA Forest Service; Tom DeGomez, University of Arizona, Arizona Forest Health Program.

**New Mexico**  
Survey conducted June through August, 2005 by Richard Norris and Daniel Ryerson, Forest Health, New Mexico Zone Office, Southwestern Region, USDA Forest Service; Stephani Sandoval, New Mexico State University Cooperative Extension Service.
